Dear Sir,

Greetings to you. Am using localhost, Yahoo email address, SMTP server and PHPMailer 6.0.7 to send email.

However, under Yahoo settings, we still need to enable 'less secure app' (i.e. PHPMailer):

<https://stackoverflow.com/questions/41515107/how-can-i-send-mail-with-phpmailer-without-enabling-less-secure-app-access-in/41519058#41519058>

Was wondering if amending the attached 'get\_oauth\_token.php' file accordingly:

```
switch ($providerName) {
    case 'Google':
        $provider = new Google($params);
        $options = [
            'scope' => [
                'https://mail.google.com/'
            ]
        ];
        break;
    case 'Yahoo':
        $provider = new Yahoo($params);
        break;
    case 'Microsoft':
        $provider = new Microsoft($params);
        $options = [
            'scope' => [
                'wl.imap',
                'wl.offline_access'
            ]
        ];
        break;
}
```

Dear Ravi, will specifying the scope for case 'Yahoo' successfully resolve this issue?

would be a step in the right direction?

Thank you so much in advance,

With Warm Regards,  
Benjamin Wong
