IP Camera CGI introduction

- The cgi listed in this article is a set of http protocol based interfaces provided by ip camera. client programs (which can be web pages or other applications running on web browsers) can perform various operations on devices through cgi.
- Security authentication for cgi: The cgi listed below require security authentication when accessing them. Moreover, different cgi interfaces require different permissions, which are divided into three levels: visitor, operator, and manager. The permissions are determined by the user set on the device. The specific security authentication mechanism supports two methods: the Basic security authentication mechanism specified in the http protocol, and directly attaching a user name and password to the cgi p.
- Methods for accessing cgi: Among all http methods, the cgi listed in this article only supports get and post, and the upgrade.cgi and restore.cgi only support the post method.

Get example

```
<form name="form2" method="get" action="cgi-bin/hi3510/cleanlog.cgi">
    <input name="cururl" type="hidden" >
    <input name="name" type="hidden" value="access">
</form>
```

Post example:

```
<form name="form5" method="post" target="retframe" enctype="multipart/form-data"
      action="cgi-bin/hi3510/upgrade.cgi" onSubmit="return upgrade()">
    <td colspan="3"><input type="file" name="setting_file" >
    <input type="submit" value=" submit" >
</form>
```

- Return of cgi: Depending on the returned information, the cgi listed in this article can be divided into two types:

✓ Obtain the cgi of the device status and parameters. If the acquisition is successful, the text containing the device status or parameters will be returned in a format similar to the variable definition in javascript. Each status or parameter will be defined as a variable and returned, such as:

```
var bps_1="2048";
var fps_1="25";
var gop_1="50";
var brmode_1="1";
var imagegrade_1="1";
var width_1="704";
var height_1="576";
```

If the acquisition fails, an error message will be returned, such as: “[Error]Get video attribution error! errcode is 0xa10e6008” .

✓ Cgi for setting device parameters or performing operations. This type of cgi returns text information containing the results of the operation, Return if successful “HTTP/1.0 200 OK”; If it fails, return specific error information, such as: “[Error][Data-Length:91] unrecognized or incomplete command line.” Indicates that the parameters attached to the cgi are incorrect.

✓ Cgi can directly enter tests in a browser as follows:

User name and password can also be attached directly
